

Andoni Aguirre Aranguren

Cloud and Automation Engineer | Azure, Google Cloud Platform | Python | RPA

Cloud and Automation Engineer specialized in **Microsoft Azure, Google Cloud, Python and RPA**. I design and build **scalable automation solutions that integrate enterprise systems, reduce manual operations and optimize business processes**.

My work focuses on **automation, systems integration and cloud solutions that generate measurable operational impact, while remaining simple, reliable and low-maintenance**.

Professional Summary

Automation engineer with experience in the design and implementation of **business process automation, enterprise integrations and cloud-based solutions**.

Ability to analyze operational workflows, identify automation opportunities and deliver **end-to-end solutions that connect enterprise platforms, automate manual processes and improve operational efficiency**.

Experience working with **enterprise systems, APIs and automation tools to orchestrate workflows, automate data processing and integrate cloud and on-premise environments**.

Key Competencies

Automation and RPA

Power Automate, Power Automate Desktop, Robotic Process Automation, Business Process Automation

Cloud

Google Cloud, Microsoft Azure, Azure Functions, Azure API Management

Development

Python, Automation Scripting, API Integrations

Integration

REST APIs, SOAP APIs, Enterprise Systems Integration

Data

SQL, Snowflake, Azure Table Storage (NoSQL)

Professional Projects

Enterprise Process Automation and Systems Integration

Design and implementation of automation solutions to optimize business processes and reduce manual operations in enterprise systems.

Key contributions:

- Analysis of business processes and identification of automation opportunities
- Automation of operational workflows in enterprise platforms including **SAP, Workday and Snowflake**
- End-to-end integrations using **Azure Functions and cloud services**
- API integrations using **REST and SOAP services**
- Automation pipelines that connect multiple enterprise systems and enable automated data exchange

These solutions improved operational efficiency **by reducing manual processing and enabling automated workflows between systems.**

Data Extraction and Processing with AI

Design of solutions to extract structured information from unstructured documents using cloud AI services.

Key contributions:

- Data extraction with AI using **Microsoft Azure AI Foundry**
- Transformation of **unstructured text to JSON**
- Automated processing pipelines integrating extracted data into enterprise workflows

This enabled the **automation of document processing tasks that previously required manual data extraction.**

RPA Solutions and Hybrid Automation

Implementation of automated workflows for operational tasks in environments where direct system integrations were not available.

Key contributions:

- Automation of repetitive business tasks using **RPA technologies**
- Integration of **desktop automation with cloud services**
- Automation solutions operating in **hybrid environments combining on-premise systems and cloud platforms**

These automations **significantly reduced manual work and operational processing time.**

Technologies

Microsoft Azure, Google Cloud, Python, Power Automate, Power Automate Desktop, SQL, Snowflake, Azure Table Storage

Current Learning

AI Agents with Python and Claude Agents SDK, Asyncio and concurrent programming in Python, VHDL for hardware design, Relational Databases and SQL
